

Meaning

Rehabilitation is a key part of managing disasters. Since disasters are unexpected events, they need special responses, not regular procedures. The government must work together with different departments to quickly help those affected. Rescue teams need special skills, the right attitude, and the latest tools to handle disasters effectively. Although we can't always stop disasters from happening, we can reduce their damage through good disaster management.

Points

1. Rehabilitation in Disaster Management:

- Rehabilitation is a critical part of disaster management.

2. Non-routine Nature of Disasters:

- Disasters are unpredictable and require special, non-routine responses.

3. Government's Role:

- The government cannot rely on normal procedures; it must adopt specific measures to respond effectively.
- Proper coordination between various government departments is essential to provide quick relief.

4. Rescue Teams:

- Rescue teams need to learn special skills and develop the right attitudes to handle disasters.
- Teams must also be equipped with the latest technologies for effective disaster response.

5. Importance of Disaster Management:

- Disaster management has gained greater importance in recent times.

6. Focus of Disaster Management:

- The goal is not to prevent disasters (which may not always be possible) but to reduce their impact.

7. Mitigation of Impact:

- While disasters can't always be avoided, effective management can help mitigate their harmful effects.

Questions

1. Why is rehabilitation important in disaster management?
2. Why do disasters require special, non-routine responses?
3. How should the government coordinate its response during disasters?
4. What skills and tools do rescue teams need to deal with disasters effectively?
5. What is the main goal of disaster management if preventing disasters is not always possible?
